Serverless WebRTC

What's it about?

WebRTC is an emerging web technology to enable direct browser-to-browser communication. Currently mainly web-servers are used to exchange the connection information among peers (browsers). This project aims to build a real peer-to-peer framework, where all peers can talk to each other without a central server, based on the WebRTC technology.

Goals:
- Framework for browser-to-browser communication without central servers based on WebRTC.

Interests:
- HTML5, Javascript
- Protocols
- Cryptography
- Explore new technologies

Impact:
- Enable the development of distributed, serverless and real cross-platform applications.
